

1 WELDED MONO PART
Strands are individually hand tied to a breathable welded monofilament, which is a stronger French lace material that provides longer lasting durability. This construction technique simulates natural hair growth while allowing for free movement. These wigs are designed with a specific part in mind to preserve the integrity of the style and overall density.

2 LACE FRONT
Extends from ear to ear. Strands are individually tied to a sheer lace section to mimic a natural hairline, allowing for off-the-face styling.

3 WEFTING
Wefts are a collection of fibers or strands sewn together at their tips, creating a linear gathering of fibers. They are then posted to the laces of the cap to create the base construction.

4 LACES
Extend from the nape to the top, providing stretch throughout the base, molding to the shape of your head, and ensuring a secure, custom fit.

5 VELCRO ADJUSTMENTS
Velcro adjustments at the nape are used to adjust and customize the circumference of your wig.

6 EAR TABS
Used to adjust the placement of the wig for a proper fit. The ear tabs are covered in a velvet material, covering flexible wire stays that bend to the sides for a more custom fit.
